

DESCRIPTION

The EV2456-J-00A is an evaluation board for the MP2456, a high-voltage step-down regulator with a built-in power MOSFET.

MP2456 achieves a 0.5A peak-output current over a wide input supply range with excellent load and line regulation. Current-mode operation provides a fast transient response and eases loop stabilization.

The MP2456 is available in a TSOT23-6 package and requires a minimal number of readily-available external components.

The EV2456-J-00A is a fully assembled and tested evaluation board. It generates a +12V output voltage at load current up to 0.5A from a 15V to 50V input range.

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output between 15 and 50V, and then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The MP2456GJ will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.35V to turn on the regulator, drive EN less than 1.17V to turn it off.
6. Use R5 and R6 to set the output voltage with $V_{FB} = 0.812V$. R5 can be calculated by
$$R5 = \left(\frac{V_{OUT}}{0.812V} - 1 \right) \times R6$$
 once R6 is determined.
